

ANNA LOGOR™ COSMETICS

«Anti-Aging» Treatment

For mature skin.

Salon cosmetology procedure

What is **Mesotherapy**?

Mesotherapy without injections is a new technology that provides the introduction of active ingredients in the middle layers of the skin and has a long-lasting recovery effect. Skin aging, cellulite and problems with the surface layer can be successfully treated with Mesotherapy. Our products for Mesotherapy are specially designed to stop aging of the skin. Powerful active ingredients significantly increase the production of collagen / elastin, reduce the amount of free radicals and enrich the mesoderm with vitamins and minerals. This revolutionary anti-aging program helps to smooth wrinkles, restores skin tone, elasticity and provides a healthy appearance. This method is non-invasive, but still provides amazing results that can be seen at the first session.

How does **Mesotherapy** work?

Classical methods of treatment Mesotherapy by the method of acupuncture, have been very successful in combating the withering of the skin. A special cocktail of the product, which is injected under the skin, is an ideal means for smoothing wrinkles and wrinkles, and also as a firming drug against sagging of the skin. However, this method has a number of negative side effects: the skin is broken by a needle - bruising and pain at the injection site are very common, and there is a danger of infection if there is a violation of sanitary norms. Several years ago, two European companies Maya beauty engineering from Italy and Nora Bode from Germany proposed a new method of mesotherapy: mesotherapy without injections. To deliver the goods to the mesoderm, they used oxygen at a pressure of up to 2 bar or 30 psi. This method was evaluated by the Fraunhofer Institute for Biomedicine positively in that oxygen significantly increases the penetration of the product into the skin. Our specialists went one step further and divided the system of treatment with Mesotherapy into 2 parts. The first part of the system consists of using exclusively in cosmetology salons (indicated below). The professional system uses the same ultrasound machines available for most salons. Instead of using an expensive Oxygen plant as a product delivery device, the waves created by the Ultrasonic Unit can be used to guide the product through the top layer of the skin with the greatest effect.

The second part of the system consists of a series of products for Mesotherapy for daily care, including: **Mezotherapy Firming Moisturizer**, **Mezotherapy Night Cream** and **Mezotherapy Serum** - another important attribute that allows active ingredients to penetrate further than conventional creams. The actual active ingredients of molecular engineering are so small that they can freely penetrate the skin to the middle layer. This allows you to reach the product of the area where the skin cells are actively dividing, which ensures the achievement of maximum results. The purpose of Mesotherapy is the basal membrane, located between the epidermis and the dermis, as well as the upper layer of the dermis, the so-called papillary (papillary) layer. The basal membrane performs mechanical protective and nutritional functions for the epidermis. The papillary layer provides nutrition to the epidermis through the basement membrane.

Membrane. The papillary layer consists of an important group of cells called fibroblasts. These cells are responsible for the production of collagen. Collagen is about 70% of the dermis and forms a network of microscopic fibers that provide structural support to the skin. Under the influence of mimic facial muscles occurs the appearance of age folds and wrinkles. With aging of the skin, these fibroblasts no longer produce enough collagen, which causes loss of strength, resulting in wrinkles. This slowdown in the production of collagen is due to biological factors. Biological aging occurs when the body's metabolism slows down, resulting in fewer nutrients reaching the cells, resulting in slower work. This, the so called - phytoaging. Another type of aging

that has negative effects on the skin is photoaging. Photoaging occurs when environmental factors such as sunlight, smog and environmental pollution cause the creation of free radicals in the skin. These free radicals damage collagen fibers, which leads to an increase in wrinkles and folds. As you can see, both types of aging are one common factor; Collagen fibers are weakened to such an extent that they are unable to maintain their elasticity. This leads to increased sagging of the skin, as well as to the appearance of wrinkles and folds. To slow the progression of skin aging or even reverse, we must increase the production of collagen and reduce the amount of free radicals in the skin.

Sequence of the procedure:

1. Prepare the skin by thoroughly cleaning it with **Vital Primrose Cleanser**.
2. Exfoliate the skin with one of the following actions: Microdermabrasion device or **Marine Scrub** or **Biogomm'age Scrub**.
3. Apply a 1-2 mm layer of **Pre-Steam Gel** to the face and leave for 8-10 minutes.
4. Wipe your face and neck with **Vital Primrose Toner**.
5. Apply a layer of 1-2 mm thick **Vital Primrose Mask**. Place the gauze napkin on top of the mask and cover with warm paraffin. Keep it on the skin for 15 minutes (the use of paraffin is not mandatory).
6. After removing the paraffin layer, use a damp cotton pad or a wet towel to remove the remainder of the mask. Wipe using **Vital Primrose Toner**.
7. Apply **Mezotherapy Serum** over the entire face and neck area.
8. Apply the Ultrasonic device within 3-4 minutes (if desired).
9. Apply a small amount of **Mezotherapy Firming Moisturizer** (for the face and neck) and **Anti Wrinkle Eye Cream** (eye area). With the help of circular, massage movements, fully incorporate the cream into the skin of the face and neck.
10. Complete the procedure by applying a sufficient amount of **Mezotherapy Gel** on the face and neck. Conduct manual massage for up to 3 minutes to facilitate the penetration of active ingredients into the skin.

Cosmetological products required for the procedure
